Writing YARA rules

An introduction to YARA for AIL usage

What's YARA?

- *The pattern matching swiss knife for malware researchers (and everyone else)*;
- It's an improved **grep** to create pattern matching rule to search for **strings**, **binary patterns**, **regular expressions**;
- A YARA rule can be contextualised with metadata and tags describing a specific set of pattern matching rules.
- Easier definiton of conditions compared to regex.

A sample rule - disneyplus.yara

```
1   rule disney_plus : credential_leak
2 {
3       meta:
4           description = "Finding list of credentials for
      Disney Plus"
5           leak = 1
6       strings:
7           $a = "gmail.com:"
8           $b = "DISNEY_PLUS"
9           $c = "Disney Plus"
10      condition:
11          $a and ($b or $c)
12 }
13
```

Calling yara from command line

- Searching a single file

```
1 yara disneyplus.yara /home/adulau/dataset/2021/09/01/
      nv6RsKFm
2
```

- Searching a directory

```
1 yara disneyplus.yara -r /home/adulau/dataset
      /2021/09/01/
2
```

Regular Expressions

- Regular Expressions (Regex) are extremely useful in extracting information from text
- A regex is a sequence of characters that specifies a search pattern
- They can be used to match, locate extract and replace text

Regular Expressions

You can search for simple letters and specifiy repetition or existence

```
String: ‘Cookie‘

// ‘.‘ Any single character
$re1: /Co.kie/

// ‘*‘ Zero or more for the previous sequence
$re2: /Co*kie/

// ‘+‘ One or more for the previous sequence
$re3: /Co+kie/
```

Regular Expressions

```
1 // ‘{2,3}‘ Between 2 and 3
2 $re4: /Co{2,3}kie/
3
4 // ‘[a-zA-Z]‘ Any letter between ‘a‘ and ‘Z‘
5 $re5: /Co[a-zA-Z]kie/
```

Regular Expressions

Usecase: Email addresses

```
$re1: /.+@.+\..+/
// The address ‘1@.‘ is valid

$re2: /.+@.+\.[a-zA-Z]{2,4}/
// We enforce a correct TLD (i.e. ‘.com‘)
```

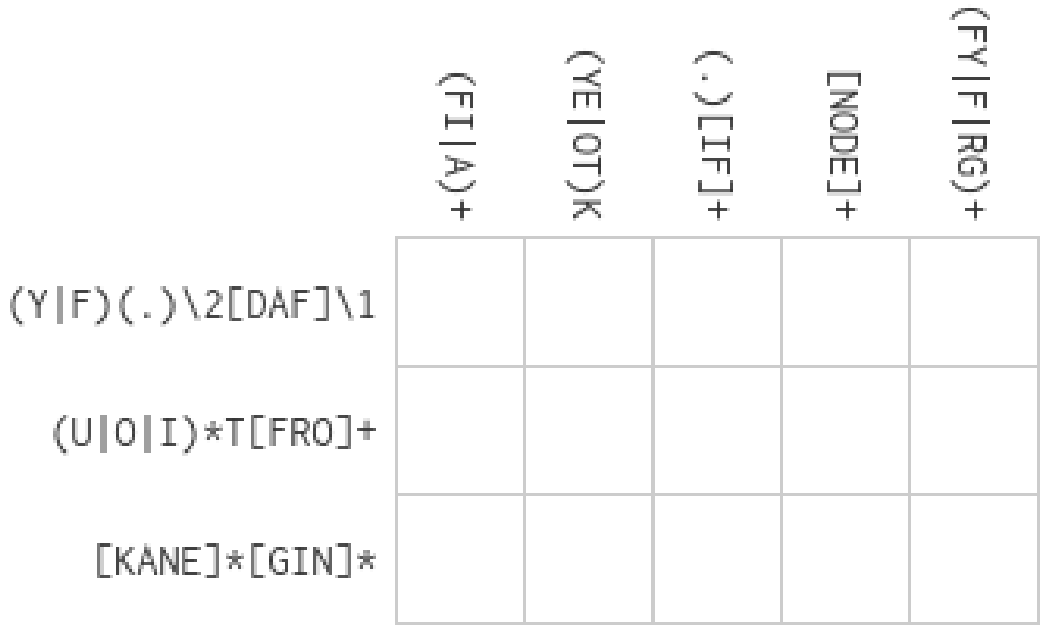
Regular Expressions

Usecase: Email addresses

```
1 $re2: /.+@[a-zA-Z0-9_.-]+\.[a-zA-Z]{2,4}/
2 // We enforce a correct domain (i.e. ‘gmail‘ or ‘hotmail
      ‘)
3
4 $re3: /[a-zA-Z0-9_.%+-]+@[a-zA-Z0-9_.-]+\.[a-zA-Z]{2,4}/
5 // We enforce a correct email format
6 // ‘!john@doe~@gmail.com‘ is not valid anymore
```

Fun with Regular Expressions

`https://regexcrossword.com/`



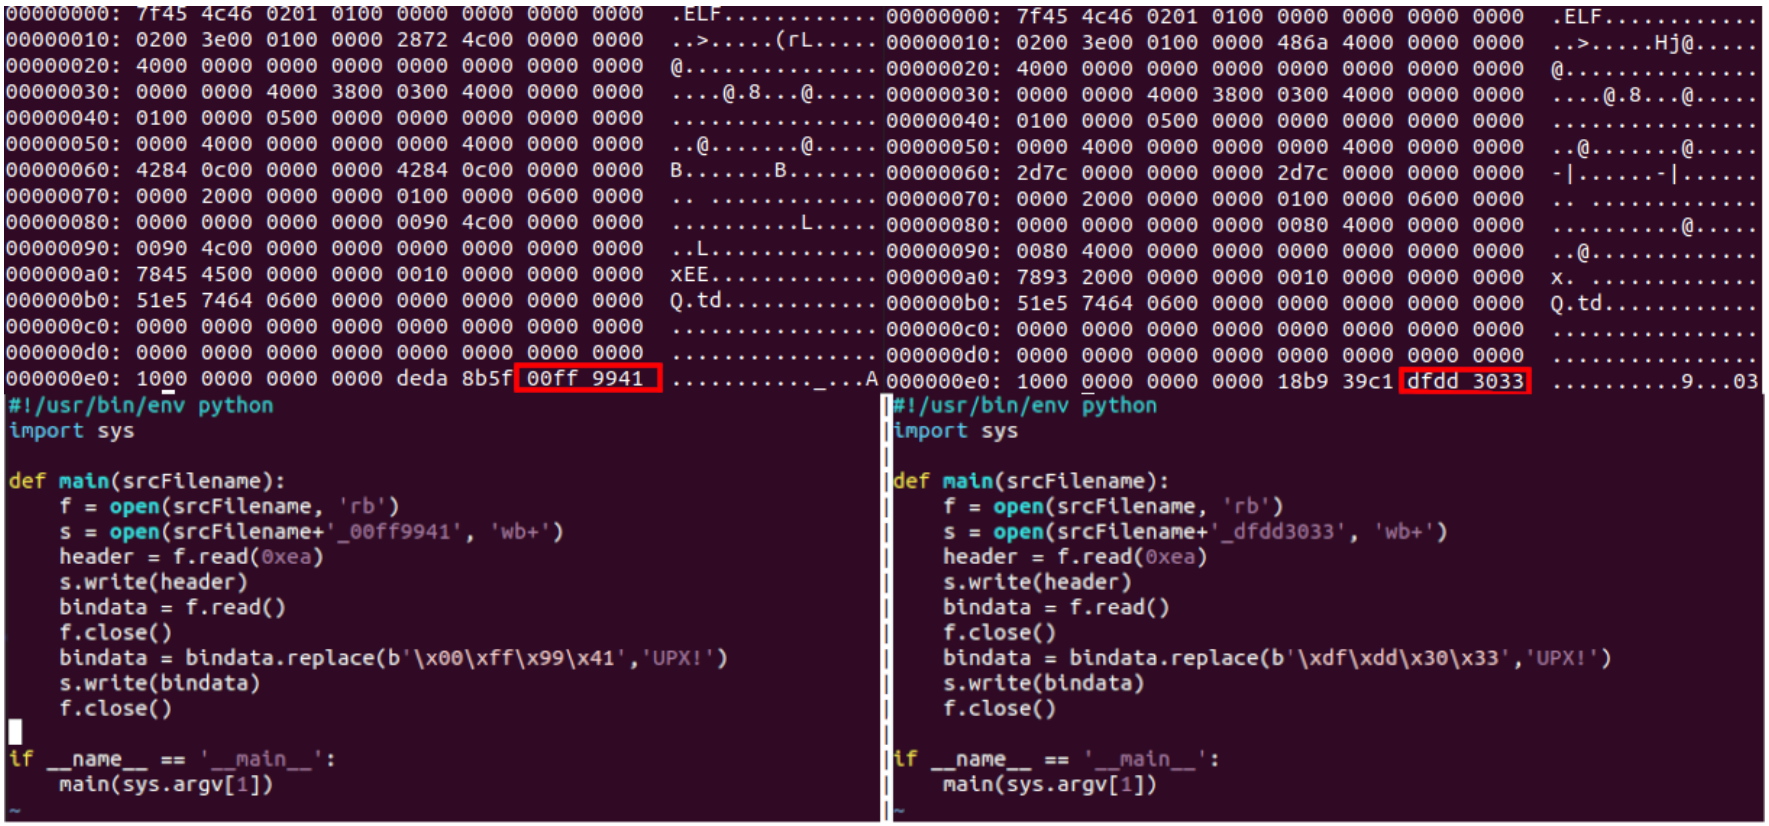
Fun with Regular Expressions

`https://regexcrossword.com/`

	`(FI|A)+`	`(YE|OT)K`	`(.)[IF]+`	`[NODE]+`	`(FY|F|RG)+`
`(Y|F)(.)\2[DAF]\1`	F	O	O	D	F
`(U|O|I)*T[FRO]+`	I	T	F	O	R
`[KANE]*[GIN]*`	A	K	I	N	G

Searching in binaries

Binaries packed with UPX but made unusable by UPX -d by modifying the magic UPX string:



Searching in binaries

```
rule torcryptomining
{
    strings:
        $upx_erase = {(00 FF 99 41|DF DD 30 33)}
    condition:
        $upx_erase at 236
}

```
